Chemical Reaction Engineering - I
M.M. : 20

Time : 60 mins
Note:

- Mention your Roll number, class and name at the top of all the pages/answer sheets. Put your signatures on the right bottom of each sheet.
- Scan all the pages/answer sheets as a single pdf file and upload the same in the Google form of Google Classroom.
- Attempt all questions.
I. When aqueous $A$ and aqueous $B\left(\mathrm{C}_{\mathrm{A} 0}=\mathrm{C}_{\mathrm{B} 0}\right)$ are brought together they react in two possible ways

to give a mixture whose concentration of active components $(\mathrm{A}, \mathrm{B}, \mathrm{R}, \mathrm{S}, \mathrm{T}, \mathrm{U})$ is $\mathrm{C}_{\text {total }}=\mathrm{C}_{\mathrm{A} 0}=\mathrm{C}_{\mathrm{B} 0}=$ $60 \mathrm{~mol} / \mathrm{m}^{3}$.
Find the size of mixed flow reactor needed and the R/S ratio produced for $90 \%$ conversion of an equimolar feed of $\mathrm{F}_{\mathrm{A} 0}=\mathrm{F}_{\mathrm{B} 0}=300 \mathrm{~mol} / \mathrm{hr}$
II. Starting with pure feed A, consider the first order reaction followed by a zero order reaction $A \xrightarrow{k_{1}} R \xrightarrow{k_{2}} S$ taking place in a plug flow reactor. If intermediate R is the desired product, find $\mathrm{C}_{\mathrm{R}, \max } / \mathrm{C}_{\mathrm{A} 0}$ and the time in which maximum R can be reached.
III. The following elementary reactions, having $\mathrm{k}_{0}=0.025, \mathrm{k}_{1}=0.2 \mathrm{~min}^{-1}, \mathrm{k}_{2}=0.4 \mathrm{lt} / \mathrm{mol} . \mathrm{min}$ are to be run in four equal sized mixed flow reactors.
The feed is $\mathrm{C}_{\mathrm{A} 0}=1$, feed flow rate $v=100 \mathrm{lts} / \mathrm{min}$

To maximize the fractional yield of $S$,
(a) How would you arrange the four mixed flow reactors system?
(b) With your best system, what would be the volume of your four reactors?
